

The figure displays a regression model's performance. The green line represents the true function, which is smooth. The red line represents the model's predictions, which are highly volatile and overfit to the training data points (yellow dots). The pink shaded area represents the 95% confidence interval, which is very narrow in regions with training data and very wide in regions without. The legend in the bottom right corner identifies the components: true_function (green line), predictions (red line), 95% CI (pink shaded area), and train_data (yellow dots).
